

Assessing the alternative livelihood options for climate change vulnerable coastal fishing villages in Kerala, India.

ABSTRACT

Fisheries and allied sectors provide means of livelihood to millions of people around the world. In India more than 14.5 million individuals depend on fisheries for their livelihood, with Gujarat, Tamil Nadu and Kerala being the main three marine fish producing states of the country. The social and economic contribution of fisheries as a sector cannot be ignored or go unnoticed. Similarly the impact of climate change on fisheries and its resultant impact on the livelihood of fisheries dependent communities cannot be ignored. To address these pertinent issues, we first need to understand the impact of climate change on fisheries and the need of alternative livelihood options from the perspective of the direct stakeholders i.e. fishermen. This study is an endeavour to look at the need of Alternative livelihood options (ALOs) because of climate change among the coastal communities in Poonthura and Elamkunnappuzha villages of Thiruvananthapuram and Ernakulum respectively. Among the 222 marine fishing villages of Kerala, Poonthura and Elamkunnappuzha are the major fishing villages from the South West hotspot locales of India. The examination investigated different socioeconomic aspects, for example, fishing activity, basic household data, economic as well as historic and cultural dependence on fishing, employment and occupational structure, income distribution and assets, physical capital, financial capital, social capital, and exposure and awareness of the fishermen families to climate change by ~~taking interviewing~~ 1259 ~~samples fishermen~~ from Poonthura and Elamkunnappuzha. The study conducted in the most climate change vulnerable marine hotspots of Kerala (Elamkunnappuzha and Poonthura) explains the problems and prospects of the inhabitants in the sector and the importance of Alternative Livelihood Options (ALOs) in climate change adaptation.

Keywords: climate change, vulnerability, fishermen, Alternative Livelihood Options (ALOs), adaptive capacity.

1.INTRODUCTION

Indian fisheries sector is a sunrise sector with varied resources and potential, engaging over 14.50 million people at the primary level and many more along the value chain. The marine resources of the country comprise an Exclusive Economic Zone (EEZ) of 2.02 million sq. km, a continental shelf area of 5, 30,000 sq. km and a coastline of 8,118 km. The marine fishery potential in the Indian waters have been estimated at 4.41 MMT constituting more than 47% demersal, 48% pelagic and 5% oceanic groups. India had annual marine fish landings of 3.63 million tonnes in 2016. Around 29.2 per cent of the total fish production of the India is from the southwest region of the west coast of the country comprising Kerala, Karnataka and Goa, of which 49 per cent contribution is from Kerala. A state-wise analysis of the estimates indicates that the maritime states of West Bengal, Kerala, Karnataka, Maharashtra, Gujarat and the U.T. of Daman & Diu registered increase in landings whereas the other coastal states Odisha, Andhra Pradesh, Tamil Nadu, Puducherry and Goa recorded a decline. Gujarat retained the top position among the states with 7.74 lakh t landings followed by Tamil Nadu which landed 7.07 lakh t. For the first time Karnataka attained the third position pushing down Kerala into 4th position with 5.30 and 5.23 lakh t respectively. In Kerala the marine fish landings during 2016 was 5.22 lakh t showing an increase of 7%;pelagics contributed 61%, demersals 25%, crustaceans and molluscs 7% each. Kerala, Karnataka and Goa together produced 11.13 lakh t which accounted for 31% of the total landings in the country. In spite of a continuing decline in oil sardine landings, Kerala attained 8% increase in the total landings in 2016 (CMFRI Annual Report, 2016-17; CMFRI Marine Fisheries Census, 2010).

With a coastline of over 590 Km, and an exclusive economic zone (EEZ) of 218536 Sq Km, Kerala has a significant marine fisheries sector that has long been an important source of occupation and livelihood for the coastal population of the state. The fishermen population is around 3.1 per cent of

53 the state population, residing in 222 marine fishing villages and 113 inland fishing villages of the state.
54 Out of this, 7.88 lakh fishermen belong to Marine sector while 2.36 lakh fishermen belong to Inland
55 sector. Alappuzha (1.90 lakh) is the district with largest fishermen population, followed by
56 Thiruvananthapuram (1.70 lakh) and Ernakulam (1.36 lakh) (Economic Review, 2016).

57 It is a fact that, the socio-economic condition of the fisher folk in the State is pitiable, when compared
58 to the general section of the population. Backwardness is the hall mark of fishermen. They are in the
59 grip of subsistence economy and indebtedness in the normal aspects of their life. Many reasons could
60 be accounted for this state of affairs. Among social, economic and educational and such other
61 reasons, the depletion of fishery wealth is a major cause (Dept of Fisheries, Govt of Kerala).

62
63 In a state like Kerala where unemployment is the crucial problem, fisheries sector plays a vital role in
64 providing jobs to thousands. Fisheries sector contributes directly and indirectly to the generation of
65 employment in the State, and such sectors must be given due importance to tackle the unemployment
66 problem in the State (Alavy Kutty P.M, 2004).

67
68 In relevance to Kerala's fishing scenario, there is an urgency to carry out sea-friendly fishery practices
69 to be adopted soon considering the global decline in the marine fisheries production. However while
70 doing the same, there should be proper checks and balances, as a large number of populations have
71 been dependent on fishing historically and therefore, livelihood concerns of poor fishermen should be
72 kept in mind (Natasha Kuldeep,2015).

73
74 Even though the state of Kerala is rated among the top three maritime states of the country, still there
75 are illiterate/semiliterate and indigent fishermen who lack the knowledge of latest fishery technologies
76 and proper attitude towards fishery development (Chakrabarthy et al., 2005).

77
78 Furthermore Shyam *et al.* (2014) reported low level of awareness on climate change among fisher folk
79 of Kerala owing to the fact that climate change issues are entangled with other developmental issues;
80 thereby community could not decipher climate change issues in particular. According to the reports of
81 Ridgway (2007a);Cai *et al.* (2005); Cai (2006); the impacts of climate change is expected to be
82 observed in the southern part of India. The impacts of climate change are expected to be different
83 within and between regions and nations, and thus it is important to investigate where climate change
84 impacts on fisheries have greatest social and economic significance (Allison et al.2009).

85
86 According to the study conducted by Shyam *et al.* (2014), Thiruvananthapuram and Ernakulam
87 districts are the highest vulnerable villages in Kerala based on the vulnerability index table formulated
88 by using the Patnaik and Narayin method. With respect to the Vulnerability index table, the highest
89 vulnerable villages of Thiruvananthapuram and Ernakulam District i.e. Elamkunnappuzha and
90 Poonthura Villages were selected as the units of study. (Shyam et al.,2014). The vulnerability of
91 Poonthura (2.85) was found to be higher than Elankunnappuzha (2.80). The results revealed that
92 majority of the fisher households in both the villages were highly vulnerable to climate change which
93 is a major cause of concern.

94
95 Under the above pretext, a study directed in the selected coastal regions of Poonthura and
96 Elamkunnappuzha fishing villages to get an understanding about the level of awareness of fishers
97 about climate change and the importance of alternative livelihood options is relevant. It draws
98 consideration as it is directed at two of the marine hotspots in the nation which encounters high
99 vulnerability to climate related shocks and stress along with a higher vulnerability index as the
100 communities are located near the coastline. Hence, a study regarding the socioeconomic profile of
101 such fishing villages is worth enough to be used as a basis to develop proper adaptation mitigation
102 strategies for the fisher folks to climate change through alternative livelihood options.

103
104 As the ability to sustain fisheries will rest on a mechanistic understanding of interactions between
105 global change events and localised disturbances, it is important to recognize the regional responses
106 to climate change. It is also important to recognize the importance of the changes in these parameters
107 as drivers of change in marine organisms including fish. Initiating a commitment on long- term
108 environmental and ecological monitoring programmes is important as such data cannot be collected
109 retrospectively. Projections on climate change impact on fish populations need to be developed as the
110 first step for future analytical and empirical models and for planning better management adaptations.
111 Effort is also required in- respect of raising awareness of the impact, vulnerability, adaptation and

112 mitigation related to climate change among the decision makers, managers, fishermen and other
113 stakeholders in the fishing sector. (E. Vivekanandan, 2010).

114

115 Climate change and its impact was a debated topic for a long time, but now we know that it is a
116 reality. It has changed in Past, is changing in Present and will change in Future. So it is high time that
117 we focus on the adaptation and mitigation plans at national and regional levels. The term mitigation
118 refers to efforts to cut or prevent the emission of greenhouse gases - limiting the magnitude of future
119 warming. It may also encompass attempts to remove greenhouse gases from the atmosphere.
120 Mitigation may require us to use new technologies, clean energy sources, change people's behaviour,
121 or make older technology more energy efficient. Mitigation differs from climate change adaptation,
122 which refers to the actions taken to manage the unavoidable impacts of climate change.

123

124 The study undertaken will help in understanding the level of awareness about climate change among
125 the fishermen community, problems faced by coastal communities due to climate change and the
126 methods followed by them to overcome it, ALOs available etc. Besides this, it will also help us in
127 finding out the preferred climate change adaptation and mitigation plans among the fishermen
128 community and thus help in preparing a robust strategy to overcome the problems due to climate
129 change. Understanding the impacts of climate change on fisheries is crucial as fisheries is important
130 for food security, livelihood, and generation of employment and foreign exchange for national
131 government.

132

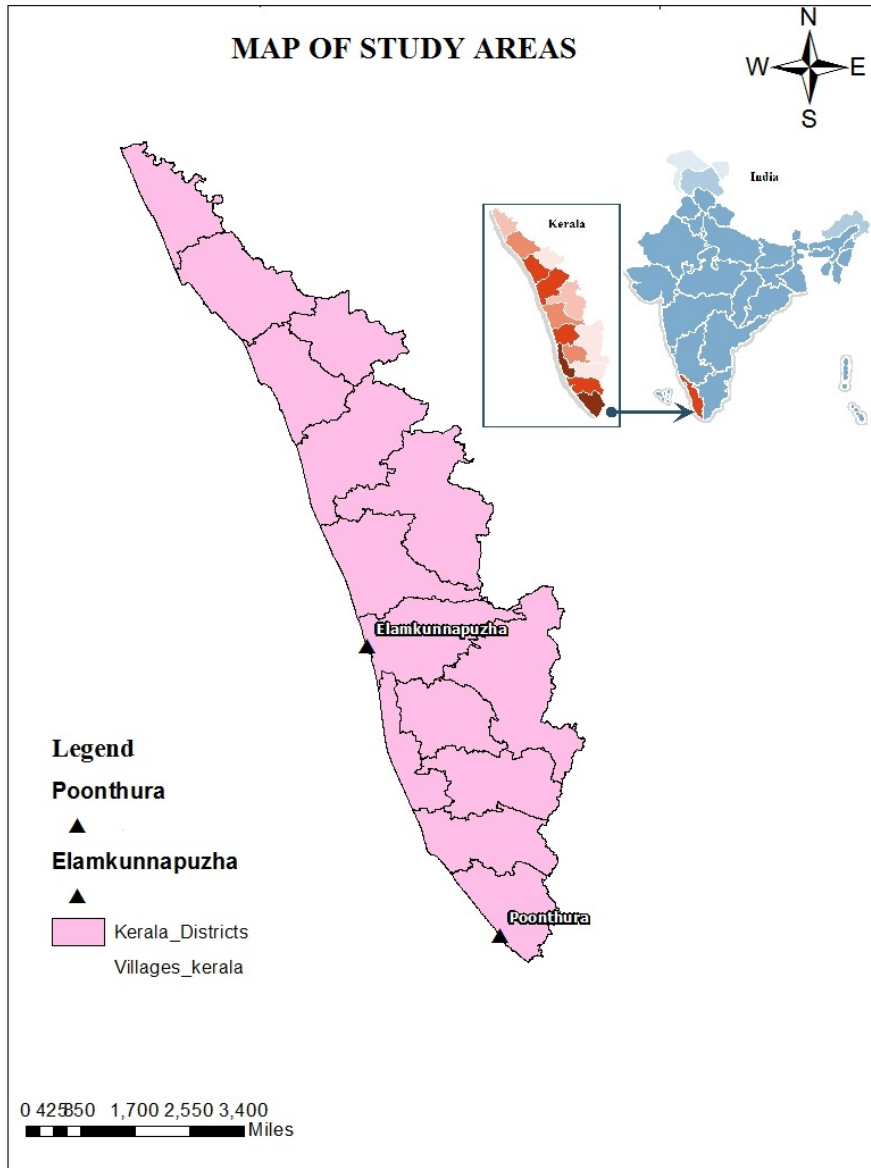

133 **2. MATERIALS AND METHODS**

134 **2.1 Location**

135 | The study ~~is~~ was conducted in the coastal villages of Poonthura and Elamkunnapuzha situated in
136 Thiruvananthapuram and Ernakulam respectively.

137 Thiruvananthapuram, the capital of Kerala, has the maximum number of fishing villages (42nos) in
138 Kerala constituting around 19 per cent of the state total (CMFRI Marine Fisheries Census, 2010).
139 Coastal village of Poonthura is inhabited by around four per cent of the total fishermen families and
140 six per cent of the total fisherfolk population of Thiruvananthapuram (CMFRI Marine Fisheries
141 Census, 2010). It is one of the major fishing villages from the south west hotspot regions of India lying
142 between 10° 00' N and 76° 15 E.

143 Ernakulam with a coastal length of 46 Km has a fishermen population of 1543 per Km length is one of
144 the major fishing district of Kerala. Elamkunnapuzha village in Ernakulam district has a total
145 population of 51,197 and an area of 11.52 sq km. It has a distinct ecosystem that includes capture
146 and culture fisheries, a variety of agricultural crops, and animal husbandry. Elamkunnapuzha village is
147 one of the other major south west hotspot regions of India lying between 10°1'0"N 76°13'0"E. Figure 1
148 clearly marks the study area.

149 |
 150 Figure 1. Study Area
 151

152 **2.2 Data collection**

153 A pre-tested interview schedule was used for the collection of information directly from the fishermen
 154 families through personal discussions and interviews regarding the various aspects of the socio-
 155 economic conditions. A total sample of 1259 respondents was selected from the coastal villages of
 156 Poonthura and Elamkunnappuzha through random sampling method. Information gathering was done
 157 to collect data on socio economic and demographic view of the respondents, level of awareness of
 158 fisher folk about climate change, fisher's perception on the impacts of climate change on resources
 159 and resource users, sources of information on climate change, Alternative livelihood options available
 160 and preferred, climate change adaptation actions and the need of more training etc.
 161

162 **3. RESULTS AND DISCUSSION**

163 The result of the particular study undertaken is discussed below under the headings socio-economic
 164 profile, climate change impacts on their livelihood and Alternative Livelihood Options (ALOs).

3.1 Socio-economic profile

3.1.1 General profile

Out of the total 1259 respondents, 588 were from Elamkunnapuzha and 671 were from Poonthura. The male female ratio was slightly skewed towards the male side in both study areas. Majority (59%) of the respondents from Elamkunnapuzha belonged to Hindu community, whereas in Poonthura 90 per cent of them belonged to the Christian community. Majority (34%) of the respondents from Elamkunnapuzha belonged to the age category 46-55 and 33 per cent from Poonthura belonged to the category 35-45.(Given in Table 1)

181
182
183

3.1.2 Family members

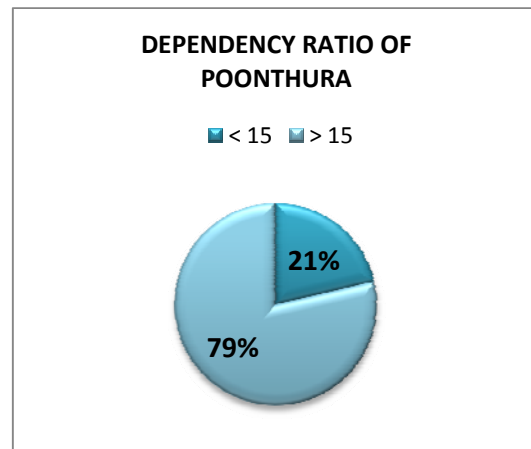

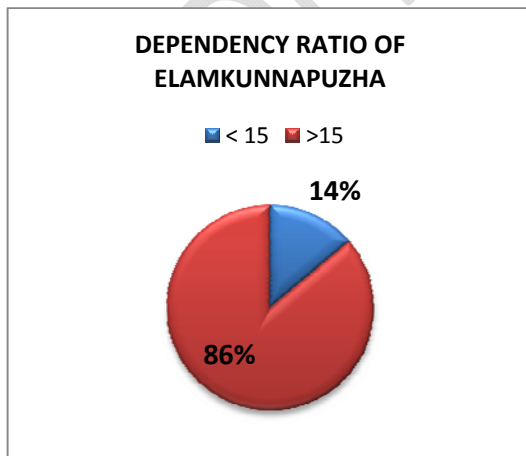

Family members in Elamkunnapuzha village comprised mainly adults (86%) and children constituted only a minor 14 per cent of the total family members. In Poonthura 79 per cent were adults and 21 per cent were children as shown in Table 2.The dependency ratio of both the villages is given in Figure 2.

184

188

189 3.1.3 Main occupation

190 According to the response, about 44 per cent of the respondents of Elamkunnapuzha village
191 considered fishing as their main occupation, while others ~~deal-see~~ it as a part time occupation. In
192 Poonthura 90 per cent of the respondents ~~have-consder~~ fishing as their main occupation as given in
193 Table 3.

208

209 3.1.5 Fishing trips per week

210 The study revealed that 32 per cent of the fishermen respondents in Elamkunnapuzha village ~~are~~
211 ~~going-for-make~~ 4 to 5 fishing trips in a week whereas about 45 per cent of the fishermen respondents
212 in Poonthura ~~are-going-for-make~~ more than 5 fishing trips per week. An infinitesimally small per cent
213 of the fishers in Elamkunnapuzha have less than three fishing trips a week. While probing the details
214 about the duration of a fishing trip it is found out that about 46 per cent of the respondents from
215 Elamkunnapuzha and 11 percent from Poonthura did not have any response to the question (Given in
216 Table 5).

257

3.1.11 Average expenditure pattern

Rent, food, medicine and education were the main expenditure drivers in case of both Elamkunnapuzha and Poonthura. As depicted in figure 3.

258

259 **Figure 3. Expenditure pattern**

260

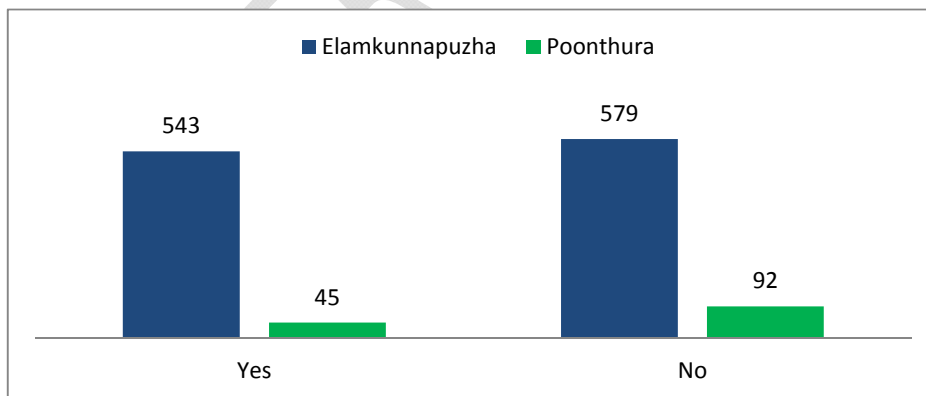

3.2 Climate change impacts on their livelihood

262 Fisheries' being heavily dependent on weather and climate is ~~going to get~~ substantially affected by
263 the changes in climate and environment. These changes can thus directly or indirectly create
264 repercussions in the life of the fishermen dependent on it for their livelihood.

265

3.2.1 Climate change impact awareness

267 Majority (92 %) of the respondents from Elamkunnapuzha and 86 per cent from Poonthura have
268 heard about climate change impacts from different sources such as friends ,family members, media,
269 newspapers, social websites, community groups etc (Figure 4).

270

271

272 **Figure 4. Climate change impact awareness level**

273

3.2.2 Source of information

275 Major sources of information related to climate change impacts in Elamkunnapuzha were newspaper
276 and media. In case of Poonthura, newspaper, media, family members and friends were the major
277 sources of information (Figure 5)

278

288

289 **Figure 5. Source of information**

290

291 **3.2.3 Climate change impacts experienced in day to day life**

292 Figure 6 and 7 give details of climate change impacts experienced in day to day life by the inhabitants
 293 of Elamkunnapuzha and Poonthura villages.

294

318 **Figure 7. Climate change impacts of the inhabitants of Poonthura**

319

320 3.2.4 Willingness to know more about climate change

321 Sixty three per cent of the respondents from Elamkunnappuzha and 76 per cent from Poonthura are
 322 willing to know more about climate change. This shows the interest among the fishermen community
 323 to know more about climate change and contribute more towards the adaptation and mitigation plans
 324 (Given in Table 11).

325

326 **Table 11. Willingness to know more about climate change**

	Yes	No
ELN	373	215
POON	511	160

327

328 3.2.5 Willing to participate in any climate change adaptation activities

329 Majority (60%) of the respondents from Elamkunnappuzha and 72% from Poonthura are willing to
 330 participate in any climate change adaptation activities. From this we can conclude that a vast majority
 331 of the fishermen community are willing to be a part of the climate change adaptation and mitigation
 332 strategies (Table 12).

333

335

336 3.2.6 Type of climate change adaptation activities willing to participate

337 Majority (61%) of the respondents from Elamkunnappuzha would like to take part in individual climate
 338 change adaptation activities followed by household (37%), social (21%), institutional (10%) and
 339 communal (6%). In case of Poonthura majority (50%) of the respondents favoured social activities

340 followed by communal (27%), household (14%), individual (13%), institutional (7%) and political (2%)
 341 (Table 13).

342 **Table 13. Climate change adaptation activities willing to participate**

343

344 **3.2.7 Climate change displacement**

345 In Elamkunnappuzha only a small percentage (3%) reported to be displaced due to climate change
 346 whereas in Poonthura 13 percent were displaced due to climate change as shown in Table 14. A vast
 347 majority of respondents from both the villages responded that they were not displaced due to climate
 348 change.

351 **3.2.8 Fear of displacement in future due to climate change**

352 In Elamkunnappuzha and Poonthura 10 per cent and 20 per cent respondents respectively has fear of
 353 displacement due to climate change in future. Fifty one per cent of the respondents from
 354 Elamkunnappuzha and 74 % from Poonthura have no fear of displacement due to climate change in
 355 future (Table 15).

357

358 **3.2.9 Climate change adaptation measures practiced**

359 Using transportation alternatives, Organic Farming, increasing energy efficiency, reducing food waste,
 360 avoiding products with lot of packaging and rain water harvesting are the popular climate change
 361 adaptation activities being practiced among the coastal communities of Elamkunnappuzha and
 362 Poonthura fishing villages. The details of climate change adaptation measures practiced by
 363 inhabitants of both villages are given in Table 16 and 17.

3.3 Alternative Livelihood Options (ALOs)

3.3.1 Alternative livelihood options

Thirty two per cent from Elankunnapuzha and 19 per cent from Poonthura have Alternative Livelihood options whereas 61 per cent from Elankunnapuzha and 67 percent from Poonthura have no Alternative Livelihood options other than fishing. From this we can conclude that majority of the respondents are completely dependent on fisheries and has no other means to survive, if left without it (Figure 8).

Climate change is something that can affect the coastal community at multidimensional levels, the most important being their livelihood. Right to livelihood being a fundamental right, is something that is guaranteed to every citizen of India. So it is important that the researchers and policy makers work hand in hand to make this changing situation a boon. According to our study, thirty two per cent from Elamkunnapuzha and 19 per cent from Poonthura have Alternative Livelihood Options whereas 61 per cent from Elamkunnapuzha and 67 percent from Poonthura have no Alternative Livelihood Options other than fishing. From this we can conclude that majority of the respondents are completely dependent on fisheries and has no other means to survive, if left without it. Daily wage labour, SHG, Small Scale Industry, Service Industry and Masonry/carpentry are the top five ALOs preferred by fishermen in Poonthura and Elamkunnapuzha fishing villages. Climate change has already been experienced in many parts of India with several seasons of intense storms, droughts, floods, fires etc. Any further delay in addressing the issue would put at risk many more lives, livelihoods and investments for decades to come.
